

Patch Cord to smooth steps from changing MIDI2CV8 CV Out

Assemble a resistor and capacitor as a simple low-pass filter into the cover of a mini-phone plug of patch cords used to link CV outputs such a Pitch Wheel, Modulation, Channel-pressure, etc. to smooth the steps resulting from the single byte MIDI message resolution. Mark the plug and/or cable so it is obvious to you the end with the components goes to the MIDI2CV8 or other source and that it isn't used in unintended patches.

A tantalum, miniature electrolytic, or, large surface mount capacitor will provide the best fit. The plus pole goes to the resistor/wire node.
